

Introduction:

This SRS document describes the requirements and major component interactions of the Web-Based SIM System. It covers how users, security personnel, and the administrator interact with the system to report, manage, and monitor security incidents.

Purpose:

To provide a central web platform where students, villagers, staff, landlords/agents, and indigenes can report security incidents, and where security personnel and the administrator can monitor, track, and respond to them.

Scope:

The SIM system facilitates:

1. Incident reporting by users.
2. Incident status tracking by users.
3. Alert and dangerous area notification.
4. Report and user management by Admin and Security Personnel.

Major Components and Their Interactions.

The system has 3 major components that interact as follows:

1. User Component

Actors: Student, Villager, Staff, Landlord/Agent, Indigene.

Interaction: Registers/Logs in → Submits incident report → Views report status → Receives alerts and views dangerous areas.

2. Security Personnel Component

Actor(s): Security Personnel.

Interaction: Logs in → Views all incident reports → Updates incident status → Manages assigned reports.

3. Administrator Component

Actor(s): Administrator.

Interaction: Logs in → Manages all incident reports → Manages system users → Oversees system data.

All components interact through the central SIM Database which stores users, reports, alerts, and status information.

Functional Requirements:

Requirement(s)	Description(s)
User Registration and Login .	The system allows all users to create an account and log in with valid credentials.
Incident Reporting.	The system allows registered users to submit incident details including type, location, date, time, and description.
Incident Status Viewing.	The system allow users to check the current status of reports they submitted.
Alert and Dangerous Area Display.	The system notify users of new incidents and display areas marked as high-risk.
Report Management.	The system allows the Security Personnel and Admin to view, update, and manage all incident reports.
User Management.	The system allows the Admin to manage user accounts.

Non-Functional Requirements:

These describe how the system should perform.

1. **Usability:** The system has a simple interface that can be used by students and villagers with minimal training.
2. **Performance:** The system is able to respond to user actions within 3 seconds under normal network conditions.
3. **Reliability:** The system ensures submitted incident data is stored accurately with no loss.
4. **Security:** The system restricts access based on user roles and protect personal and incident data.
5. **Availability:** The system can be accessed anytime provided there is internet connectivity.
6. **Accessibility:** The system shall be responsive and work on mobile phones, tablets, and desktops.

Conclusion:

This SRS defines the functional and non-functional requirements of the Web-Based SIM System and explains how the User, Security Personnel, and Administrator components interact to achieve the goal of improved campus and community safety.
